

Entrepreneurship Education and Pedagogy

The texture of entrepreneurship programs: Revisiting experiential entrepreneurship education through the lens of the liminal-liminoid continuum

Journal:	<i>Entrepreneurship Education and Pedagogy</i>
Manuscript ID	EEP-19-0023.R2
Manuscript Type:	Unsettling Entrepreneurship Education Special Issue
Keywords:	Entrepreneurial learning, Liminal, Liminoid, Texture, Entrepreneurial Development Programs
Abstract:	<p>Positioning the liminal and the liminoid on a continuum, we define a 'space' within which practice-led, experiential learning occurs. The more liminal processes within this space are associated with familiarity, wide social recognition and relative security; the more liminoid are allied with risk-taking, innovation, creativity, and higher levels of uncertainty. Our research was conducted amongst student/founders on M-Entrep, an integrated Masters and venture creation program. Our findings suggest it is the co-existence of the liminal program experiences, such as the 'rite of passage' of obtaining a Masters qualification, that act as a safety net as students embrace the fluidity and lack of security associated with the more liminoid experiences many associate with the venture creation endeavor. We argue that M-Entrep is an example of a program that interweaves liminal and liminoid processes, creating a texture that is both open and containing, facilitating 'entrepreneurial' and encouraging students to re- imagine themselves in new roles and statuses. By exploring entrepreneurship education (EE) through the lens of the liminal and the liminoid continuum, facilitators of EE programs can better appreciate, design and influence the texture of this space to benefit the student learning experience.</p>

I. Introduction

Despite the growth in experientially-orientated entrepreneurship courses, the literature contains very limited details of these programs, the challenges they face and suggested solutions for overcoming them (Mandel & Noyes, 2016). By working with the concept of the liminal-liminoid continuum, this article contributes to the growing call for a more robust critical debate and unsettling of experiential entrepreneurship education (Berglund & Verduyn, 2018) based around the action of *entrepreneuring*, more than the fact of *entrepreneurship* (García-Lorenzo, Donnelly, Sell-Trujillo and Imas, 2018).

The notions of liminal and liminoid have been extensively theorized by anthropologists when explaining the construction of meaning during critical events, like birth and death, and the rituals and ceremonies (baptisms, circumcisions, funerals) usually associated with them. Building on the seminal works of van Gennep (1960 [1909]) and Turner (1967, 1969, 1987 [1967]), the liminal and the liminoid have been used in multiple ways to make sense of change, mobility, transition, transit, in-betweenness, any state of hybridity or transformation (Thomassen, 2009).

Positioning the liminal and the liminoid on a continuum creates a lens through which practice-led, experiential learning can be explored. We suggest the lens of the liminal and the liminoid continuum provides new insights into the ways students transition to a new status as entrepreneurs, placing them in a position of 'in-betweenness' (Nielsen & Gartner, 2017).

Experiential spaces are the scenarios for a multiplicity of displacements and transfigurations that can sometimes be identified as visible phases collectively experienced, but more usually are intrinsically ambiguous, non-chronologically performed and have a meaning as a critical event for the individual. Many traditional approaches to teaching entrepreneurship emphasize being *about* entrepreneurship rather than teaching *for*

1
2
3 entrepreneurship (Hannon, 2005) or *doing* entrepreneurship reflexively (Sarasvathy & Dew,
4 2008). However, there is a growing interest in entrepreneurship education that emphasizes
5 *doing* entrepreneurship reflexively, and with it in experiential approaches (Lackéus & Williams
6 Middleton, 2015; Mandel & Noyes, 2016).
7
8
9
10

11
12 An increase in entrepreneurship practices and the development of EE is seen as a priority
13 by policy makers, linked both to employment and economic benefits, and to the development
14 of democracy and entrepreneurial citizenship (Kyrö, 2015; Urbano & Guerrero, 2013). These
15 courses contain both *content work* looking to achieve specific outcomes, such as venture
16 creation, and *process work* aimed at the development of personal qualities (Fayolle & Gailly,
17 2008). The nature and intensity of the experiential design features can though vary extensively,
18 at one end of the spectrum comprising small projects or guest lectures from entrepreneurs to
19 full blown venture creation programs at the other. Experiential interventions are seen by their
20 advocates as beneficial to the development of entrepreneurial attributes (Corbett, 2005;
21 Sukavejworakit, Promsiri & Virasa, 2018), though their views are not uncontested.

31
32
33
34
35

36 In this paper we explore how the concepts of liminality and liminoidity and the liminal-
37 liminoid continuum can be applied to experiential learning in the context of an EE program. In
38 bringing new insights into participants' experiences and the texture of the learning space they
39 are inhabiting, we suggest this lens can also reveal hidden implications for our interventions.
40 To illustrate our argument we draw on the experience of an integrated Masters and venture
41 creation program: 'M-Entrep' (name changed).
42
43
44
45
46
47
48
49

50 The M-Entrep program was selected as it sits close to the experiential extreme of the taught
51 provision-experiential learning continuum, with participants studying a full-time Masters in
52 parallel with creating a new venture throughout the program. M-Entrep's positioning on the
53 continuum offered a clear opportunity to surface and explore influences, interventions, tensions
54
55
56
57
58
59
60

1
2
3 and contradictions that contribute to the texture of the learning space participants may occupy
4
5 in experiential EE programs.
6

7
8 Participants embrace a variety of roles and statuses during the program, for example:
9
10 student; founder; product developer; illustrator; employee; etc. Often these roles and statuses
11
12 are held and experienced concurrently and participants may switch between them more
13
14 consciously than is typically the case. This increases the complexity and ambiguity of
15
16 negotiating their roles. Nonetheless, whilst the moniker of ‘student’ does not fully recognize
17
18 this complexity, we adopt it in this paper for the sake of clarity.
19

20
21 In the light of this complexity, the research question we seek to address in this paper is:
22
23 “How might the lens of the liminal-liminoid continuum provide new insights into the texture
24
25 of the experiential EE learning space, the interplay of the processes within such programs and
26
27 and how this may influence the learning and development of students as emerging
28
29 entrepreneurs?”
30
31

32
33 Our findings have implications for educators delivering integrated venture creation-
34
35 education programs as well as those involved in delivering executive and non-accredited
36
37 education to entrepreneurs beyond the higher education boundary.
38

39
40 In this paper, we first introduce our contextual framework and the concepts of liminal and
41
42 liminoid. Then, we review relevant literature, making the case for the interrelationship of these
43
44 notions as useful in broadening our understanding of experiential learning for entrepreneurship.
45

46
47 Next, we describe the M-Entrep program, our research methodology and limitations and
48
49 how we understand M-Entrep through the lens of a liminal-liminoid continuum, before
50
51 discussing our findings and their implications. We conclude by noting how our research
52
53 contributes to the evolving field of EE.

II. A review of the theoretical framework

II.1. The liminal and the liminoid

The term *liminality* was introduced by the anthropologist Arnold van Gennep (1960 [1909]) to refer to the experience of crossing the spatial and temporal limits (from Latin, *limes*) that exist in a rite of passage (liminal events) in traditional societies. Liminality is produced socially and individually. The anthropologist Victor Turner (1967), discussing Van Gennep, further introduced the concept of *liminoid* to refer to how liminality operates in contemporary societies. When traditional rites are diluted, the liminoid (individual, ambiguous, not socially constrained transfigurations in spaces and time) occurs. Both authors focused in particular on the in-between spaces and transfigurational moments when apparent distraction and ambiguity are experienced, but Turner emphasized the capacity of the subject in the liminoid to “elude or slip through the network of classifications that normally locate states and positions in cultural space.” (Turner, 1967, 98). Liminoid states encourage reflexivity by representing ourselves, in contrast with liminal rituals. Unlike rituals, they are not obligatory but voluntarily chosen. What is considered a liminoid state from the anthropological tradition, is usually understood as a “present-day extension” (Ibarra & Obodaru, 2016) from the organizational behavior perspective or as “relational processes of enactment” (García-Lorenzo, et. al, 2018, 391) in organizational studies.

The liminal and the liminoid are part of a continuum (Turner, 1982 [1974]; St John, 2008). Turner himself considered the liminoid “historically continuous with ritual” (1982 [1974], 72). Whereas liminal is integrated into the established order of the social world, the ‘liminoid’ challenges these structures by offering optional alternatives to the social order (Daskalaki and Simosi, 2018). In their recent study of unemployed adaptation, Daskalaki and a Simosi argued that unemployed people oscillate between liminal and liminoid states; they adapt to a new condition from an old one, but they also develop a “reflexive state of being”, placing

1
2
3 themselves in a non-fixed “liminoid position” which allows for alternative selves to be
4 performed (Daskalaki and Simosi, 2018, 1157). Indeed, anthropologists have described
5 liminoid as populated, in contrast with rituals, by moments “where creativity and uncertainty
6 unfold” (Thomassen, 2009, 15).
7
8
9

10
11
12 Literature has found inspiration in the concepts of liminal and liminoid to explain changes
13 in everyday life. Bridges (1980 [1974]) has referred to the liminal as a “neutral zone”, a space
14 of reconstruction, an empty space where a new sense of the self could gestate. In a more
15 sophisticated elaboration, Rosi Braidotti (1994) suggested acknowledging transformational
16 status - the liminal and mobile, nomadic transitions - as existential conditions of social
17 regeneration. From the point of view of Braidotti, we are in a permanent liminoid state, even
18 without intending or noticing, as we are subject to the transformations of the (organizational)
19 communities we belong to. Researchers of organizing processes like Case and Gaggiotti (2014)
20 are also beginning to learn how to move with actors (Latour, 2005) - to follow flows and
21 apprehend reticular processes and assemblages that emerge. Actors/actants enter into relations
22 with one another while also being separable, moving constantly between van Gennep (liminal)
23 and Turnerian (liminoid) spaces.
24

31
32
33
34
35
36
37
38
39

40 Indeed, rather than considering liminal and liminoid as distinct categories, Andrew Spiegel
41 (2011) positioned them on a linear continuum, proposing that events have varying degrees of
42 liminality or liminoidity. Spiegel describes 5 attributes that differentiate the more liminal from
43 the more liminoid: 1) degree of transformative potential (rebellion may typically reverse to
44 status quo or more revolutionary potential); 2) degree of permanency/predictability (existing
45 within social structures); 3) nature of occurrence (cyclical social processes to erratic around
46 individual interest); 4) meaning (retrospective with meaning for society-future orientated with
47 meaning for individual/interest group); 5) context (centered on tradition with ‘mechanical’
48 solidarity to centered on fluent relationships with organic solidarity). Spiegel applies this
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 continuum model to explore the potential for events to be misinterpreted by participants and
4
5 observers as truly liminal in the pre-modern sense, thus raising unrealistic expectations of the
6
7 magnitude and longevity of the transition it can create. Ibarra & Obodaru (2016) propose an
8
9 alternative interpretation and define six characteristics of liminal experiences (finite time
10
11 bracket, socially-guided, legitimate narrative to support sense-making, progressive outcome,
12
13 simultaneous objective/subjective state, and obligatory nature), applying the first 4 to reflect
14
15 more accurately less-institutionalized, contemporary experiences, such as portfolio careers. We
16
17 observed both overlaps and differences in these two models and in our discussion we draw on
18
19 4 characteristics that our research revealed are most relevant to the case of M-Entrep:
20
21 meaning/sense-making; obligatory nature; temporality; and rhythm and social guidance.
22
23
24
25
26
27

28 **II.2. Roles, role transitions and entrepreneurial learning**

29
30 Neck and Corbett (2018) argue that EE programs aim to prepare students to start new ventures
31
32 through the development of an entrepreneurial mindset and associated skills and practices. This
33
34 development process, particularly in the case of educational programs that involve real venture
35
36 creation, can involve students undertaking several roles - student, founder, product developer,
37
38 leader, etc. In a manner not dissimilar to those seeking a voluntary career change, in a passage
39
40 through the program, students will dwell in liminal-liminoid experiences. They explore, trial
41
42 and may eventually integrate their new selves using the entrepreneurial activities and the new
43
44 relationships and networks associated with these activities as means of elaborating possible
45
46 selves (Donnellon, Ollila & Williams Middleton, 2014; Ibarra, 2003). Being betwixt and
47
48 between these roles, and the influence these liminal-liminoid experiences have on the role-
49
50 holders are not necessarily smooth or linear. Students may try out, or be required to fulfil,
51
52 different roles depending on the context. And the context may change and cycle frequently –
53
54 for example: founder when pitching to investors; student when defending academic
55
56
57
58
59
60

1
2
3 assignments; digital artist when discussing product development - contributing to the existence
4
5 of multiple selves. This experiential learning takes place in an environment of 'doing it for
6
7 real' so is not pure 'identity play' (Ibarra & Obodaru, 2016), as students may be claiming or
8
9 being granted roles in the presence of real customers and investors and be expected to
10
11 demonstrate an evolving entrepreneurial competence.
12
13

14
15 In this sense, the student learns to build a story whose narrative thread is both grounded in
16
17 the present or here-and-now and woven into the imagined future as they develop the capacity
18
19 for what Lindberg and Schwartz (2018) refer to as a future oriented process of thinking. This
20
21 way of thinking stands in contrast to traditional education, which emphasizes building a story
22
23 in the past with the intention of learning from cases, and 'applying' extant theories, examples
24
25 and literature to 'experiences' as the main vehicle for 'learning' to 'apply' knowledge to
26
27 situations in the future.
28
29

30
31 Future oriented processes of thinking require the actor to embrace and dwell in uncertainty
32
33 and ambiguity (Barnett, 2007), offering deep learning potential and provoking levels of anxiety
34
35 that, if not sufficiently contained, discourage learning (Vince, 1998). Students need, therefore,
36
37 to be resilient learners and to experience a learning context that offers "good enough"
38
39 containment of anxiety (Stacey, 2010). Mitchell (1983) suggests among the reasons for actors
40
41 not to be resilient are the need to avoid risk due to the instability and inconsistencies produced
42
43 through social construction of statuses that may or may not fit with individual representations
44
45 of the selves (Goffman, 1959).
46
47
48

49
50 During the production of multiple selves in a liminoid space, a person is "suspended"
51
52 between statuses (Turner, 1969, 1987 [1967]). Research is abundant on how the construction
53
54 of multiple selves (Noble and Walker, 1997) instead of a single monolithic representation, is
55
56 generally socially punished as inconsistent, incoherent, and even dangerous (Ladge, Clair &
57
58 Greenberg, 2012; Hebl, King, Glick, Singletary & Kazama, 2007). If we want students to
59
60

1
2
3 explore multiple selves, the organizational learning space should be supportive of this
4 exploration. Gherardi (2006, 2009) has referred to practice-led organizational learning spaces
5 as “textures”, where interrelated practices form an action-net of repeatedly renewing and
6 transforming the self. This is the textural nature of M-Entrep.
7
8
9
10

11
12 Berglund and Verduyn (2018) have referred to the entrepreneurial self as an open
13 “template”, from which various kinds of entrepreneurial selves are configured. Analytically, it
14 informs us of the myriad of entrepreneurial ‘becomings’ that can be produced by combining,
15 say, “education + enterprise + responsibility + creativity + freedom + opportunity + future”.
16 (p. 10). Berglund and Verduyn (2018) go on to suggest the capacity of critical entrepreneurship
17 to stimulate the liminal-temporal dimension of the learning experience. Indeed, they claim
18 “entrepreneurship (and the education that follows) is not simply one course among others to
19 choose from, but has paved the way for how we can live the present” (p. 6). What intrigues us
20 when engaging with experiential learning in EE is how the texture of the liminal-liminoid space
21 supports development of these multiple selves and role transitions and what impact this has on
22 students’ learning and choices. We argue the lens of the liminal-liminoid continuum, grounded
23 as it is in anthropology, brings a broader perspective which allows us to explore roles and their
24 transitions and the influence of the texture of the learning space.

44

45 **II.3. Experiential learning and the liminal-liminoid continuum**

46
47 There is extensive literature exploring the relationship between liminality, learning and
48 associated emotions. Although, in most cases liminality is associated positively with creativity
49 and innovation (Garsten, 1999), the liminal is often considered troublesome for students - a
50 phase during which they grapple with significant ‘threshold’ concepts, but that once grasped,
51 enable them to emerge with a renewed level of understanding or an outlook that may be
52
53
54
55
56
57
58
59
60

1
2
3 transformational in nature (see, for example: Land, Rattray & Vivian, 2014; Land, Meyer &
4
5 Flanagan, 2016; Rose, Leisyte, Haertel & Terkowsky, 2018).
6
7

8 Tempest and Starkey (2004) highlight positive and negative impacts of liminality on both
9 individual and organizational learning, adopting Garsten's (1999) interpretation of temporary
10 workers being liminal subjects who exist 'betwixt and between' the temporary employing
11 organization and the world beyond. One benefit Garsten cites is the possibility of increasing
12 their "portfolio of experience" through interaction with multiple communities of expertise. In
13 the context of students on experiential EE programs, they are exposed to a valuable range of
14 new communities from fellow nascent entrepreneurs to seasoned business leaders and investors.
15
16
17
18
19
20
21
22
23
24

25 The literature suggests the majority of educational programs that take a more experiential
26 approach expose students to short-term experiences - such as opportunity identification and
27 assessment, industry placements or other types of engagement with experienced entrepreneurs
28 or investors - periodically dispersed within a core didactic, lecture program, whilst other
29 programs involve students creating and operating simple businesses as a short-term assignment
30 (Vincett & Farlow, 2008). It recognizes numerous shortcomings in these attempts to introduce
31 experiential learning at modest levels into EE programs (Henry & Lewis, 2018; Ferreira, Reis
32 & Miranda, 2015; Neck & Corbett, 2018; Pittaway & Cope, 2007). These include: the lack of
33 a curriculum that reflects the dynamic, temporal and iterative nature of real entrepreneurship
34 and its associated learning processes; the limited emotional attachment to tasks; and the lack
35 of critical incidents and crises from which entrepreneurs learn (Johannisson, 2016; Taatila,
36 2010).
37
38
39
40
41
42
43
44
45
46
47
48
49
50
51

52 Although still relatively limited in number, over the last decade, there has been an increase
53 in programs that require students to create a new venture as the core learning vehicle for the
54 duration, or a substantial portion, of an entrepreneurial educational program (Lackeus &
55 Williams Middleton, 2015; Ollila & Middleton, 2011; Sadek & Loutfy, 2013; Tosey, Dhaliwal
56
57
58
59
60

1
2
3 & Hassinen, 2015). The study and evaluation of these integrated venture/educational programs
4
5 has been limited to date but has indicated the potential to overcome some of the shortcomings
6
7 listed above as well as bridging the ‘valley of death’ between developing a concept for a
8
9 potential venture and securing investment (Lackéus & Williams Middleton, 2015).
10
11

12 With the literature advocating experiential learning for entrepreneurship development so
13
14 strongly, it is easy to conclude that ‘more is better’ in this regard, and venture creation could
15
16 be positioned as the ultimate in experiential EE. However, potential challenges have been
17
18 highlighted in programs that encompass substantial venture creation activity suggesting they
19
20 are not without potential challenges. These include: multiple stakeholders possessing differing,
21
22 and sometimes conflicting, measures of success (Matlay, 2005, 2006, 2009) or fundamentally
23
24 different philosophies (Hannon, 2005); recruiting and/or training suitable faculty (Mandel &
25
26 Noyes, 2016); ensuring a suitable culture of enterprise within the host institution (Ollila &
27
28 Middleton, 2011); a curriculum that lacks both a critique of entrepreneurship and learning and
29
30 experiences relevant to non-venturing careers (Berglund & Verduyn, 2018); and the potential
31
32 of the limiting of a safe space to learn through failure and critical reflection (Cope, 2005, 2011).
33
34
35
36
37

38 Exploring these challenges through the lens of the liminal-liminoid continuum brings new
39
40 insight into the tensions that exist between different aspects of programs like M-Entrep. For
41
42 example, the prescriptive curriculum-based learning and society-wide recognition associated
43
44 with a Masters degree may be considered primarily liminal in nature, being less ‘troublesome’
45
46 and less transformative than the more self-directed experiential learning associated with new
47
48 venture creation that can be considered more liminoid in nature. The intriguing question is:
49
50 how does the coexistence of these elements impact the students’ overall learning in an
51
52 integrated Masters/venture creation program?
53
54
55
56
57

58 **III. The case of M-Entrep**

59
60

1
2
3 The primary source of data for this research was a UK University-based program - referred to
4 as M-Entrep. M-Entrep combines an incubation program with a full-time Masters in
5 entrepreneurship. The program, influenced initially by the Alacrity Foundation scheme in
6 British Columbia (Alacrity Canada, 2019) is an economic development initiative aimed at
7 increasing the level of technology-based entrepreneurship and new venturing in a geographical
8 region of economic deprivation in the UK.
9

10
11
12 The host University works with a range of industry partners to identify challenges that
13 represent market opportunities - market gaps with potential commercial value. The industry
14 partner provides guidance and mentorship to the team that takes on its challenge, although
15 financial investment is not a requirement.
16

17
18
19 Students in the program are typically software engineers or digital creatives, often with
20 little or no previous venturing experience. After some initial cohort team-building and
21 observation the students are formed into teams of typically four members. Team composition
22 (including psychometric profiling and technical competence in areas relevant to the
23 opportunities offered) is a consideration from recruitment onwards.
24

25
26
27 The funding model is also non-traditional. Students are not charged fees for undertaking
28 the Masters and receive a one-year stipend. In return for this investment the University takes
29 an equity stake in each incorporated business. The University's strategy is to exit as an investor
30 after a business has grown sufficiently and reinvest the funds back into subsequent cohorts and
31 ventures. Notable consequences of this funding model include: a favorable ratio of applications
32 to places allows for real granularity in recruitment to align students with available challenges;
33 the stipend negates the need to take a part-time employment for the vast majority of students
34

60

1
2
3 reducing time pressures; and, unlike most start-ups, students are not exposed to the personal
4 financial risk of investing their own funds¹.
5
6

7
8 The overall initiative has three phases. In Phase 1, the students undertake a one-year full
9 time Masters in entrepreneurship in combination with an incubation process that aims to
10 develop a business opportunity to the point of minimum viable product (MVP), with a business
11 plan the team can pitch to investors. The rigidity of the Masters timetable and assignment
12 deadlines reinforce the pace of the incubation program and introduce added complexity in
13 balancing the unpredictability of the business incubation process with fixed deadlines for
14 academic work. The core assignments align to the venture creation process across the three
15 semesters, namely, market assessment, product/project management plan and
16 business/investment plan. Phase 1 - which is the subject of this paper - takes place in a
17 dedicated building on campus and all students who reach a suitable academic standard,
18 graduate at the end of this phase. Teams that have made satisfactory progress with their
19 business can enter Phase 2. Here they remain on campus as incorporated businesses, typically
20 for a further year as they get established. Successful businesses emerging from Phase 2 enter
21 Phase 3 where they are supported in integrating with the local business infrastructure and
22 secure premises off campus. Although this paper only covers Phase 1, Table 1 provides an
23 overview of the overall program for context.

Table 1

The M-Entrep Program

[insert Table 1 about here]

59
60 ¹ There is however a real opportunity cost for many who have forsaken, or at least postponed, the opportunity of securing full-time salaried employment or, in some cases, resigned from employment to enroll on the program.

IV. Methodology and Research Design

Studies of EE programs, including those with integrated venture creation programs have, in the main, collected their data via interviews with relevant faculty staff (Mandel and Noyes, 2016), with some adding data collected from students' written assignments. However, the [everyday](#) experience of students on these integrated programs has received very little attention.

Aileen Collier (2016) argues for more research methodologies and practices that acknowledge the relational, spiritual, moral and ethical dimensions of knowing instead of an acquired, specific knowledge. Our methodological choice in this research article was to give more attention to the ongoing sense-making of the entrepreneurial learning experience. Our approach was inductive and aimed to gain insights into students' [everyday](#) experience of the program. We followed Van Maanen's (2011) suggestion of "exploring", allowing the theoretical framing of our analysis to emerge from the data, using a lens that helped make sense of what we were finding.

The M-Entrep research was built around [discussion groups](#) (Given, 2008) conducted with students on two program cohorts. The choice of [discussion groups](#) as a method for data production was primarily motivated by our interest in students' broader storytelling of the M-Entrep experience. Rather than producing a collection of individual stories of experiences, we sought to provoke a dialogue and observe how multiple stories emerged from this. Researchers took the role of facilitators, guided by a semi-structured questioning route, but minimizing their interventions as much as possible. [The discussion groups, were informal, though focused, conversations, and were influenced by the information gathered from previous conversations, as well as from observations made outside the discussions by the program team. The latter were collected through depth discussions and access to two staff team members' reflective journaling.](#)

1
2
3 The student [discussion groups](#) lasted between 45-80 minutes encouraging students to
4 explore their motivations for enrolling on the program, their shifting roles and how they were
5 making sense of their [everyday](#) experience of the program. Facilitators were external to the M-
6 Entrep host university. The [discussion groups](#) were recorded and recordings were fully
7 transcribed by a third party. Transcripts were anonymized and coded, with only the external
8 members of the research team holding the coding key.
9

10
11 Each cohort comprised 20 students, the first completing their Masters May 2014-May
12 2015, and the second May 2017-May 2018. Participation in the research was voluntary. All 20
13 students from Cohort 1 took part and the [discussion groups](#) were conducted as follows: nine in
14 April 2015 (one session with each of the five intact business teams and four sessions with five
15 students in each from mixed business teams). In February 2016, nine months after completion
16 of the Masters program, one [discussion group](#) was held with six participants from a mixture of
17 business teams from Cohort 1. 17 students from Cohort 2 participated in the [discussion groups](#)
18 all with participants drawn from different teams: June 2017 (four groups), February 2018 (five
19 groups) and May 2018 (five groups).
20
21
22
23
24
25
26
27
28
29
30
31
32
33
34
35
36

37 Co-ordination of the availability of students and facilitators impacted on the timing of the
38 [discussion groups](#), so although the discussions followed similar structures and topics the
39 timings in terms of the stage at which the students were at in the program differed across the
40 two cohorts. Copies of the transcripts were analyzed by two of the authors independently and
41 the agreed themes were used as a basis for initial coding of the transcripts in NVivo v12. The
42 coding of the transcripts generated the following interlocking themes of relevance to this paper:
43 [negotiating multiple roles](#); juggling the venture creation and academic processes; [identifying](#)
44 [with key events and milestones](#); [working in the physical environment](#); reflecting on personal
45 development; negotiating the transition from workgroups to teams; and interacting with
46 stakeholders.
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 The challenge of transitioning statuses and negotiating multiple roles assigned to
4 participants emerged strongly from the data, alongside the importance of the 'texture' of the
5 space students were experiencing. This provided the inspiration for our decision to explore the
6 data through the lens of the liminal-liminoid continuum.
7
8
9
10
11

12 Our paper has some limitations. Our research was limited to two cohorts and it would be
13 interesting to study several consecutive runs, over a longer time period, and to explore the
14 experience of new and old actants (academics, entrepreneurs, founders). Our findings are
15 derived from a single program in an English university and would benefit from being explored
16 in other entrepreneurship development programs, different environments and cultures.
17
18
19
20
21
22
23

24 The Findings section that follows presents the data from the discussion groups, focusing
25 on the four strongest themes to emerge from coding the transcripts: multiple roles; the venture
26 creation and academic processes; key events and milestones; and physical environment. Other
27 themes are touched upon under these headings, where appropriate. Analyzing through the lens
28 of the liminal-liminoid continuum revealed new insights, and four characteristics -
29 meaning/sense-making, obligatory nature, temporality and rhythm and social guidance -
30 derived from the work of Spiegel (2011) and Ibarra & Obodaru (2016) proved particularly
31 illuminating.
32

39
40
41
42
43

44 **V. Findings**

45 *Negotiating multiple roles*

46
47 M-Entrep students associated themselves with multiple roles including student, product
48 developer, software engineer, founder, director, employee, shareholder. Initially many
49 struggled with meaning/sense-making in newer roles; particularly in the early months, many
50 gravitated towards roles they arrived with upon enrollment, such as 'artist' or 'gamer' and
51 found holding and switching multiple roles challenging. The multiplicity of roles carries with
52
53
54
55
56
57
58
59
60

1
2
3 it tensions between using existing craft skills and developing new skills associated with being
4
5 a business person:
6

7
8 *“I’m a 3D artist so I’ve got to get this done. This needs finishing. You kind of like go, oh*
9
10 *no we’ve got to think business now. It’s kind of like having two minds and sometimes that’s*
11
12 *a bit of a struggle for me”* (1st Cohort, April 2015).
13
14

15
16
17 *“Yeah. I was told recently that my time was now too valuable to be a developer. But I’m*
18
19 *the only developer on our team. So I was sort of thinking, “If I stop developing, we don’t*
20
21 *have a business”* (2nd Cohort, May 2018).
22
23

24
25
26 Over time and as critical reflection encouraged their meaning/sense-making, students
27
28 began to notice the pros and cons of different roles, many becoming adept at referring to the
29
30 one that brought most advantage in a given situation:
31

32
33 *“That’s one thing if you communicate as a student you can make a mistake and go back*
34
35 *again. Like for instance when we showed off our product a couple of people said this isn’t*
36
37 *so great, it would be better if you did this. If you went as a business they would probably*
38
39 *just disregard you there and then. But because you’re a student they’re more willing to*
40
41 *help you”* (1st Cohort, Dec 2015).
42
43
44

45
46
47 *“That’s one of the big things, learn how to use, like if you’re talking to anyone in the*
48
49 *Games Industry you won’t use the University tag because of the perception, but when it*
50
51 *comes down to the academic you definitely want to use it.”* (1st Cohort, Dec 2015).
52
53
54
55
56
57
58
59
60

1
2
3 Students could not always choose which role was assigned to them, with factors such as
4 being located on a campus or the presence of the University branding logo when off campus,
5 playing a part.
6
7
8

9
10 *“It means when people come around, potential publishers, they look at us as a University*
11 *team, that’s not the best thing”* (1st Cohort, Dec 2015).
12
13
14

15
16
17 The challenge is increased when members of the staff team, external partners and
18 stakeholders do not interpret and enact their role in a way that is congruent with students’
19 expectations; students typically fall back on **social guidance** and past experience and thus the
20 nature of these relationships influences the roles assigned. For example, a *mentor* taking up the
21 role of an *employer* could be experienced as unhelpful:
22
23
24
25
26
27

28 Student: *“We showed it to our boss”*

29 Researcher: *“And your boss being”?*

30 Student: *“XX” (non-academic member of the incubation staff)* (1st Cohort, April 2015).
31
32
33
34
35
36
37

38 *“At times there were people who ran to “YY” [non-academic lead of the incubation staff*
39 *team] like he was a teacher”* (1st Cohort, April 2015).
40
41
42
43
44

45 Nor was it only staff-student relationships that shifted over time, students were also
46 negotiating shifts in their teams and their growing sense of ‘cohortness’; there was an indication
47 they began to view themselves as a *communitas* (Turner, 1969):
48
49
50

51 *“It was actually quite weird when 20 of us would go down to lunch at the same time, the*
52 *whole office would be empty and we would kind of be walking around as a posse on the*
53 *campus. We’d also go out to the beach together and stuff as well. I think that really helped*
54
55
56
57
58
59
60

1
2
3 *in bringing everyone together so it wasn't just within teams that we had to think we are a*
4 *team” (1st Cohort, April 2015).*
5
6
7
8
9

10 Towards the end of their first year as they approached the stage of incorporating their
11 business, students tended to step more readily into the role of entrepreneur and to shed their
12 student role. This is reflected in their relationship with others:
13
14

15
16
17 *“The good thing now is that we're talking to investors and they treat us like that as well,*
18 *they don't treat us like students who are just experimenting, they actually treat us like*
19 *we're really companies and we do know what we're talking about, which is good, without*
20 *us even consciously having to say anything either. They just sort of get that” (1st Cohort,*
21 *April 2015).*
22
23
24
25
26
27
28
29
30

31 *Juggling venture creation and academic processes*

32
33 Students tended to categorize elements of the program as *either academic or product/business-*
34 *related and often saw the fixed temporal rhythm and compulsory nature of academic deadlines*
35 *and the fluid and organic rhythm of business development as being in tension. In these cases,*
36 *the Masters was typically seen as getting in the way of the 'real' work:*
37
38
39
40

41
42 *“So, we were going through a really busy time. My colleague bashed one [assignment]*
43 *out literally over a weekend because we had so much on ... he failed it by 5% and had to*
44 *redo it. He just thought, “Are you serious?” We're trying to start a company and you're*
45 *making him do another diary entry” (2nd Cohort, May 2018).*
46
47
48
49
50
51
52
53

54 However, particularly in the early months, some students viewed the Masters as a safety
55 net should their venture not succeed:
56
57
58
59
60

1
2
3 *“I’m pretty confident that we’re going to do well but you come out of it with a Masters*
4 *anyway so you can still apply as a PG to a lot of jobs anyway”* (2nd Cohort, Jan 2018).
5
6
7
8
9

10 There was evidence of the positive impact on their personal development of the tensions
11 inherent in studying for a Masters whilst incubating a business, of reflecting in and on action:
12

13
14 *“The thing that went best from my personal point of view was the personal development*
15 *that I went through over the program and I do see myself as a very different person from*
16 *a year ago in terms of the way I talk and the way I think”* (1st Cohort, April 2015).
17
18
19
20
21

22
23
24 *“The biggest learning for me is the jump between being, the different working, running a*
25 *business, doing the project management, building a product, the whole real-life process*
26 *of doing it”* (1st Cohort, April 2015).
27
28
29
30

31
32
33 *“I suppose it’s maybe important to look at it in regards of if the MA wasn’t there or the*
34 *9-5 wasn’t there, what would you come out with? Because it’s interesting to think ok so*
35 *maybe I worked 9-5 in the studio, I had the funding of £16,000 to run a studio I didn’t have*
36 *the MA now where would I be, like. I would have a product. Would it be to the level that it*
37 *is now? No, because part of the MA and the program really is the fact that all these mentors*
38 *are coming in and giving you feedback on your product and helping you grow in the right*
39 *directions and maybe consider things you never thought about ...”* (1st Cohort, April 2015).
40
41
42
43
44
45
46
47
48
49

50
51 The co-existence of studying the Masters whilst incubating their businesses encouraged
52 students to engage with failure as a rite of passage in their personal growth:
53

54
55 *“And now I’m kind of much more prepared. And actually I was going to say even the*
56 *negative side of things has put me through like a personal journey which I would do over*
57
58
59
60

1
2
3 *again even if I knew the business was going to fail because it's been really good personal*
4 *growth for me” (2nd Cohort, May 2018).*
5
6
7

8
9
10 *“It's like trying to put this constantly changing shape into a square box ... there's no book,*
11 *there's no answers, there's no, no-one can tell you what to do” (2nd Cohort, May 2018).*
12
13
14

15
16
17 As students progressed through the program, whilst the ‘academic’ and ‘incubation’
18 aspects of the program were still seen as distinct and separate, increasing value was attached
19 to the contribution that the structures and disciplines associated with the Masters made to their
20 entrepreneuring practices. The requirement on the Masters program to engage with critical
21 reflection encouraged students to take the stance of participant-observers.
22
23
24
25
26
27

28 *“I hate to say it but the learning journal, the critical evaluation, which I hated doing them*
29 *as much as we talked about them being a hindrance, they did force me to verbalize my*
30 *ideas or write down my ideas and then to critically look at them” (1st Cohort, April 2015).*
31
32
33
34
35
36
37

38 *“The irony is that we don't actually need the Masters but you do need the learning so it*
39 *kind of like goes hand-in-hand” (1st Cohort, April 2015).*
40
41
42
43
44

45 *“I would like to think that we didn't need the MA but if you look realistically the MA helped*
46 *us evolve from University head set to business-like behavior” (1st Cohort, April 2015).*
47
48
49
50

51 *Identifying with key events and milestones*

52

53 Within their venture teams, students highlighted key milestones, events and team-wide
54 decision points as influential. Although to some extent the nature and timing of these goals
55 were set by the program design, they did, in general, involve a degree of choice, creativity and
56
57
58
59
60

1
2
3 decision-making and impacted on their development, motivation and confidence both
4
5 individually and collectively. One key milestone was agreeing on a project to develop:
6
7
8
9

10 *“I think our team sort of settled into this status quo but I don’t think we were actually*
11 *properly comfortable with each other until we settled on a project we could focus on”* (1st
12 Cohort, April 2015).
13
14
15
16
17
18

19 *“When we actually decided what product ... I think that’s when we properly went cool,*
20 *we’re now a team, this is us, we’re focusing on, this is why we’re going to make something*
21 *awesome and we know each other now. It did take a little bit of time”* (1st Cohort, April
22 2015).
23
24
25
26
27
28
29
30

31 Other significant events which were common across most of the teams, included: deciding
32 on their industry partner and market opportunity to pursue; their first product demonstration;
33 deciding on the branding of the business; delivering their first pitch to investors; and surviving
34 their first real argument.
35
36
37
38
39
40
41

42 *Working in the physical environment*

43

44 The students were housed in a dedicated space on campus, which they generally perceived as
45 supporting their emerging roles as entrepreneurs labelling it as ‘the office’ or ‘the studio’. The
46 open-plan nature of the space contributed towards a sense of cohort, as well as to [meaning and](#)
47 [sense-making](#), setting them apart from other students whilst simultaneously benefitting, for
48 example, from facilities and resources.
49
50
51
52
53
54

55
56 *“I think it’s like that close communication, that’s something that’s quite good about the*
57 *office being small and compact. It’s that close communication within the environment*
58
59
60

1
2
3 *allows to have that constant hands on talking amongst yourselves as a team” (1st Cohort,*
4
5 *April 2015).*

6
7
8
9
10 *“And the fact that the studio is open plan, so although you’ve got your team, we still*
11 *interact with the other teams and you can still get help and advice and stuff from other*
12 *teams” (2nd Cohort, June 2017).*

13
14
15
16
17
18
19 Some students recognized the influence the physical space had in practicing transitioning
20
21 from one role to another.

22
23
24 *“The brilliant thing about that office is it is a bit like a goldfish bowl, you have people*
25 *looking in, you have people walking by, walking through and from day one we had people*
26 *coming up who are very important. You have investors, you had potential publishers, MPs,*
27 *which meant you had to be able to think on your feet and be able to pitch quickly. I could*
28 *be writing 2,000 lines of code that day and someone goes ‘oh by the way can you tell us*
29 *about your finances and what investment you’re looking for and what sales you reckon*
30 *you will achieve’; you have to be able to do that. And to begin with that was difficult and*
31 *definitely stuttering and kind of, but every single person in there has had to do that. That*
32 *skill, I thought that would be something that everyone would have problems with, but no*
33 *one has problems with it now” (1st Cohort, April 2015).*

34
35
36
37
38
39
40
41
42
43
44
45
46
47
48
49 Some teams were using their status as students and their campus location to access
50
51 resources:

52
53
54 *“For my team, in particular, we’ve really heavily used the University network in that we’ve*
55 *been able to validate our research that we’re doing for our own stuff. We have some*
56 *systems and people at this University who have PhDs who have been able to talk to us in*
57
58
59
60

1
2
3 *that way. That's been really good for us. I think if we weren't Masters students at this*
4
5 *University then we wouldn't be able to talk to them"* (2nd Cohort, Jan 18).
6
7
8
9

10 In the discussion that follows, we firstly present the four characteristics that define our
11 liminal-liminoid continuum. We then proceed to create a 'texture' of the M- Entrep program
12 by positioning on this continuum, processes of the M-Entrep program that reflect the themes
13 presented above. We then go on to discuss the insights gained from the liminal-liminoid nature
14 of M-Entrep's texture.
15
16
17
18
19
20
21
22
23

24 **VI. Discussion: The texture of M-Entrep through the lens of the liminal-liminoid**

25 Associating our interpretation of Ibarra & Obodaru (2016) and Spiegel (2011) with the
26 themes that emerged from our data, we have developed an interpretation of the liminal-liminoid
27 based on four characteristics (meaning/sense-making, obligatory nature, temporality and
28 rhythm and social guidance). Placing aspects of students' experiences on a continuum,
29 provided us with new insights and understandings into how they make sense of M-Entrep. An
30 explanation of the four characteristics used to define our liminal- liminoid continuum follows:
31
32
33
34
35
36
37
38
39

40 (i): *Meaning/sense-making*: the degree to which the significance of an experience is
41 constructed retrospectively and with meaning to the society (more liminal) or prospectively
42 and with meaning for the individual (more liminoid). For example, securing a role in their
43 newly-incorporated venture has more meaning for the individual and could be interpreted as
44 more liminoid than the act of securing a Masters qualification that is widely recognized by
45 society but may at the time be seen to be of limited value to a student who is their own employer.
46
47
48
49
50
51
52
53

54 (ii) *Obligatory nature*: the degree to which the student has a choice in participating in, or
55 influencing the experience. Producing a critical reflective academic assignment for the Masters
56
57
58
59
60

1
2
3 is compulsory in nature (liminal), whereas volunteering to lead, and then delivering the team's
4
5 pitch to investors is more liminoid.
6

7
8 (iii) *Temporality and rhythm*: the degree to which the timing or duration of the experience
9
10 is fixed and predictable for the entire cohort or more fluid and erratic, based on the readiness
11
12 of the team/individual. The timing of the graduation ceremony is set, so contributes to a more
13
14 liminal experience than say, the timing of when a team decides it is ready to demonstrate their
15
16 product to potential investors.
17

18
19 (iv) *Social guidance*: the degree of rigidity of a supporting narrative derived from social
20
21 structures or emerging more organically from a particular/individual experience. Highly-
22
23 guided and predictable experiences such as attending and being given input at lectures are more
24
25 liminal than self-initiated product development brainstorming events.
26

27
28 The four characteristics serve to describe a continuum that defines the texture of a 'space'
29
30 within which learning and practicing entrepreneuring occurs. Experiences at the more liminal
31
32 end of the continuum are obligatory, with their nature, meaning and timing dictated and guided
33
34 mechanistically, not by the students, but by others. In contrast, the nature, timing and meaning
35
36 of experiences at the liminoid end are more at the discretion of students.
37

38
39 Thus, the liminal provides a sense of stability and continuity derived from social
40
41 recognition and tradition, whilst the more liminoid supports risk-taking, creativity and the
42
43 generation of new insights. The nature and aims of the program will influence its design and
44
45 the balance between the more liminal and more liminoid processes. However, it is the presence
46
47 of processes at different points along the length of continuum and the interrelationship between
48
49 them that facilitates movement. Figure 1 below provides an example, locating a number of
50
51 student experiences of M-Entrep on the continuum. These experiences are drawn from the
52
53 transcripts of the discussion groups and the use of italics indicates terminology used by the
54
55 students.
56
57
58
59
60

1
2
3
4
5
6

Figure 1

The texture of M-Entrep and the liminal-liminoid continuum

[insert Figure 1 about here]

The figure gives an overall indication of the liminal-liminoid nature of M-Entrep, taking into account the four characteristics collectively. The vertical positioning of the processes is purely for ease of reading and is not related to any individual characteristic. Our aim is not to include every program aspect but rather to give a flavor of M-Entrep's texture.

As Universities could be viewed as pre-modern institutions with rituals, norms and rites of passage "attending lectures", "marking", "graduation", the simplistic conclusion would be that it is an inherently liminal experience in van Gennep's (1960 [1909]) terms; students are moving further towards the goal of emerging as a self-sufficient, independent, member of society. The time/space boundary of the educational experience is clearly defined by the ceremony of graduation and the bestowing of a qualification recognized by the higher education system on behalf of society at large; students are showered with messages from both the educational and political systems which set expectations of a more successful life, enhanced opportunities of employability and income (Mason, Williams, Cranmer & Guile, 2003; Khalifa, Dukhan & Mouselli, 2018).

At first sight it seems natural to categorize the Masters elements of M-Entrep and their associated processes and rituals as inherently more liminal and the incubation process as more liminoid. However, our findings suggest this is over-simplistic. Rather, we suggest, it is the coexistence of the two, the process of accommodating them, and the quality of conversations and relationships between different actors that has the greater influence on the texture of the liminal-liminoid space.

For example, the more liminoid experience of students having free rein to develop their

1
2
3 emerging venture is happening within the context and relative safety of the more liminal
4 experience of gaining a Masters qualification; the more liminal experience of being on a
5 University campus and graduating supports students' more liminoid experience of growing
6 confidence in their entrepreneurial capacities. This coexistence of the more liminal and the
7 more liminoid may be more easily recognized *between* the Masters and the venture creation
8 elements of M-Entrep. However, as their positioning on the continuum highlights, they also
9 coexist *within* these elements.

10
11
12
13
14
15
16
17
18
19 The complex texture of M-Entrep is evidenced in many ways, including through the
20 program design, the interaction of staff and stakeholders with students and the physical location.
21 For the texture to be conducive to transformation, conversations and relationships need to
22 support negotiating multiple roles. The sense of *communitas* (Turner, 1969), exhibited, for
23 example, in students forming a "posse" as they walked around the campus or the active
24 coaching of team development and dynamics are two examples of this. Being pushed to
25 develop new skills through critical self-reflection is a third.

26
27
28
29
30
31
32
33
34
35 The staff, external stakeholders and the physical space can be viewed as both contributors
36 to the liminal-liminoid texture as well as enablers supporting the students to navigate through
37 it. When these enablers are less aligned, the texture suffers. For example, as highlighted in the
38 negotiating multiple roles section above, the behavior of some staff and the physical space
39 being interpreted as an office, contributed to their perception of being 'employees' of the
40 incubation staff team, rather than emerging employers. In another example, the level of
41 guidance and team coaching varied across the two cohorts due to staff changes, with the second
42 cohort receiving less of a supporting narrative on what to expect as a team 'forms and storms'
43 and movement from work group to team was slower and patchier.

44
45
46
47

49
50
51
52
53
54
55
56
57
58
59
60
The metaphor of a "safety net" was used by a number of students and speaks to the texture
of the learning space engendered by the coexistence of the liminal and the liminoid; the safety

1
2
3 net is a 'good enough' container (Stacey, 2010) that protects against the damage of a hard fall,
4
5 without limiting movement. The existence of these more liminal experiences, with their
6
7 widespread societal recognition, allowed students to feel safer in experimenting and taking
8
9 more risks with their new venture development, supporting the development of an
10
11 entrepreneurial mindset and their entrepreneuring capacities.
12
13

14
15 Students also experienced events which acted as mini rites of passage, albeit that
16
17 recognition was limited to a narrower range of interest groups, more closely associated with
18
19 their new venture creation. These included: deciding on their industry partner and market
20
21 opportunity to pursue; their first product demonstration; deciding on the branding of the
22
23 business, delivering their first pitch to investors and surviving their first real argument.
24
25

26
27 The more liminal and the more liminoid also coexist in the assessments on the Masters
28
29 program. For example, whilst the formal assessment processes are seen as more liminal, the
30
31 nature of assessment - based as it is on critical reflection (including an emphasis on team and
32
33 team dynamics) and taking a participant-observer stance – and the learning that derives from
34
35 it are viewed as more liminoid. As our findings show, whilst the assessments were often viewed
36
37 at the time as a "hindrance" and getting in the way of the "real work" of setting-up their venture,
38
39 the discipline of reflecting on experience (including 'failure') came to be seen as making a
40
41 valuable contribution to the future development of students' ventures, as well as to their
42
43 personal development.
44
45

46
47 The more liminal obligatory nature of the Masters is reinforced as undertaking the Masters
48
49 is a pre-requisite for students receiving their stipend. This added to the incentives to submit to
50
51 the discipline of submitting assignments even when under significant time pressures from other
52
53 sources. Tempest and Starkey (2004) note the impact operating in a liminal-liminoid space can
54
55 have on time available to reflect on experiences and we gathered substantial evidence that the
56
57 pressure to drive the businesses forward impacted negatively on many students' reflection time.
58
59
60

1
2
3 This pressure was both self-imposed by the students, and reinforced by the incubation staff
4 (understandably as their performance was judged on the number of incorporated businesses
5 produced and level of investment secured), which chimes with Hannon's (2005) warnings
6 around the potential for different philosophies and measures of success between staff on
7 entrepreneurship programs. Our findings suggest that without the presence of the compulsory
8 assignments of the Masters (putative liminal) it is unlikely that much of this critical reflection
9 (putative liminoid) would have happened. It is precisely the liminal-liminoid nature of the M-
10 Entrep texture that encourages reflection, sense-making and promotes informed action.
11
12
13
14
15
16
17
18
19
20

21 The obligatory nature of aspects of preparing a business for legal incorporation can also
22 be viewed as more liminal. For example, the gaining of incorporated status and directorships
23 are roles that have been bestowed by the British legal system on behalf of society for many
24 years and both are garnished with tradition and expectations of what is to follow. The tempo
25 and timeframes implicit in the different phases of M-Entrep also err towards the more liminal,
26 encouraging the teams to apply for incorporation as soon as possible after completing their
27 Masters. The motivation behind this is primarily to create a legal vehicle suitable for
28 investment, so to some extent the time boundary for gaining the academic qualification, the
29 directorships and the incorporated status are dictated to the teams.
30
31
32
33
34
35
36
37
38
39
40
41

42 Equally, "settling on a project" contains both more liminoid and more liminal facets. On
43 the one hand, it can be interpreted as a rite of passage for the team and its development, a point
44 at which they experience a strong sense of belonging and whose importance is recognized by
45 both the staff team and the wider program cohort. On the other, each project is unique and will
46 pivot multiple times, so that there is no handbook or rule book that should be followed. And
47 whilst the program may encourage students to adhere to their timeframes for venture
48 development, there is no obligation on them to do so, or even to go ahead with the venture at
49 all, creating a textured learning space for students to re-imagine themselves and their futures.
50
51
52
53
54
55
56
57
58
59
60

1
2
3 In looking through the liminal-liminoid lens we are encouraged as entrepreneurship
4 educators to think more creatively about the ‘texture’ of the transitional space M-Entrep
5 students are inhabiting, the multiple statuses and roles open to them – and the implications for
6 the roles we step into as educators/staff members. The production of roles in these contexts is
7 more complex than just student and/or entrepreneur (Zhang & Chun, 2018), academic and/or
8 incubation expert. Students see the benefit to their personal and business development of being
9 flexible and in control of their multiple roles in an environment where role assignment by others
10 and institutions can be prevalent.

11
12 In experiencing and working with the tensions and contradictions inherent in juggling the
13 competing demands of academia and incubation, of doing business and performing as a skilled
14 ‘technician’ (coder, digital artist, programmer, etc.) students repeatedly ‘rub up against’ both
15 their own preconceptions and those others impose on them. It is an unnerving and dislocating
16 experience, requiring them to dwell in ambiguity and uncertainty and to engage in the struggle
17 of moving between roles and statuses – as one student described it, “having two minds”. Where
18 the texture of the liminal-liminoid space is conducive, it is a fertile developmental space for,
19 in the words of Victor Turner (1982 [1974]), “free or ludic recombination” (61) and an
20 “independent domain of creative activity, not simply a distorted mirror-image, mask, or cloak
21 for structural activity” (65).

22
23 And it is here that the conversations and relationships with staff and external partners exert
24 their strongest influence. For whilst students may engage in fruitful exploration emerging from
25 tensions and contradictions in taking up their own roles, when staff enact their roles in ways
26 that are incongruent with the context, the texture of the space is compromised and the
27 potentiality of the liminoid reduced. For example, when the student is in the vulnerable,
28 unsettling space of re-imagining their future (self), taking up an expert stance, telling them
29 ‘how to’ do x, can be deeply damaging; no matter how helpful the intent, in ‘rescuing’ them
30

1
2
3 from the ambiguity and uncertainty their learning is diminished and the risk is they revert to a
4 new dependency. By contrast, fostering adaptive, more fluid relationships that shift shape to
5 fit the context whilst maintaining their integrity can make both transitioning and dwelling in
6 the ambiguity easier for students to bear and for stakeholders to accept.
7
8
9
10
11
12
13

14 **VII. Conclusion**

15
16
17 The lens of the liminal-liminoid continuum encourages us to revisit our approaches to teaching
18 and pedagogies and gives us a framework for unsettling and challenging our program practices
19 and assumptions. As all educational contexts can be considered opportunities for experiment,
20 learning and transitioning to a new status, viewing through this lens may have wider
21 applicability.
22
23
24
25
26
27

28 Drawing on research on the M-Entrep program, in this paper we have shown how a
29 liminal-liminoid continuum allows us to explore the texture of the learning space. In doing so,
30 we have argued that this lens brings new insights into students' experience and their
31 implications for program design and the conversations, relationships and practices that take
32 place within them. This contributes to the debate around unsettling entrepreneurship education
33 in six ways. Firstly, we have identified four characteristics of a liminoid-liminal continuum
34 that provide insight into and understanding of integrated Masters and venture creation
35 programs and explored them through the M-Entrep case study. Secondly, the liminal-liminoid
36 continuum makes the relationships between various program design elements and how their
37 coexistence influences the texture of the learning space more visible. The metaphor of the
38 'safety net' with its open yet containing texture that provides support without inhibiting
39 movement emerges from this and provides a helpful concept for entrepreneurship educators
40 and program designers.
41
42
43
44
45
46
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 Thirdly, in making these relationships more visible, we highlight how the struggle that
4 students may have negotiating the tensions and opportunities associated with this coexistence
5 is a feature of experiential learning approaches; how these tensions and relationships are
6 handled can benefit or impede their learning.
7
8
9
10

11
12 Fourthly, and associated with this, the staff are contributors to the liminal-liminoid texture
13 as well as supporting students to navigate through it. We begin to appreciate that to support
14 students' exploration of their potential future selves there needs to be congruence between
15 student and staff roles. Staff need to be flexible and adaptable in enacting their roles to support
16 students in transitioning between roles and statuses, particularly where these roles are
17 unfamiliar and uncomfortable for students to inhabit.
18
19
20
21
22
23
24
25

26 Just as roles need to be congruent, we observe fifthly, the physical space(s) should support
27 students in a range of liminal-liminoid processes and experiences. Where this is a single space,
28 it needs to be defined but open plan, distinctly identified but accessible, rigid but malleable, on
29 campus but detached from other programs' spaces.
30
31
32
33
34

35 Finally, in differentiating between the liminoid potential of developing an entrepreneur,
36 and the more liminal potential of developing an entrepreneurial business venture, we highlight
37 the need to consider the interconnection between educational and venture creation program
38 elements and their measures of success. Supporting students to navigate through these
39 experiences can be further complicated by the presence of external stakeholders with very
40 different views on measures of program success.
41
42
43
44
45
46
47
48

49 Our more nuanced exploration of the liminal and the liminoid in relation to the M-Entrep
50 program has uncovered both the liminal aspects of incubation and entrepreneurship and the
51 more liminoid aspects of the MA program, avoiding the over-simplification of 'either/or' and
52 recognizing that each is 'both/and'. It is in the coexistence of, and the tension between, being
53
54
55
56
57
58
59
60

1
2
3 more in the liminal and more in the liminoid that encourages students to question and re-
4
5 imagine themselves out of pre-defined roles.
6
7

8 The lens of the liminal-liminoid allows us to see different program elements (venture
9
10 creation, Masters degree program) not in opposition to each other, but as interconnected and
11
12 co-existing. Therefore, we invite other researchers to explore other EE contexts, including
13
14 executive and non-accredited entrepreneur development initiatives, as well as educational
15
16 contexts beyond the EE arena.
17
18

19 When viewed through the lens of the liminal-liminoid continuum, programs of a similar
20
21 nature to M-Entrep, with a diversity of experiential and taught processes, are likely to have
22
23 similarly rich textures and accompanying challenges for students and other stakeholders. All
24
25 EE programmes may have (or perhaps should have) rich liminal-liminoid textures due to the
26
27 very nature of the subject of entrepreneurship. The approach described in this paper equips
28
29 entrepreneurship educators and the entrepreneurship community with a fresh approach to
30
31 understand more deeply, to critique and to refine, their approaches to the development of
32
33 entrepreneurial capacities.
34
35
36
37
38

	Phase 1 (0-12 months)			Phase 2 (13-24 months)	Phase 3 (25 months >)
	Semester 1	Semester 2	Semester 3		
Physical space	Dedicated space on campus			Adjacent dedicated space on campus	Commercial space in locality
Incubation activities	Opportunity Assessment and selection: Team formation Each team offered 3 challenges from industry partners – assess, pivot as needed;	Prototyping: Iterative phase to support concept development. Team development progresses and start to form identity and management roles	Minimum viable product (MVP): Prepare for incorporation. Management roles formalised	Incorporating/early stage start-up	Continued growth/recruitment;
Typically incubation milestones	Select one challenge and communicate to industry partners	Generate proof of concept	Demonstrate MVP to partner/investors Pitch for investment	Secure initial investment and first orders	Further round of investment
Masters taught input.	Market research; project management; critical reflective practice; team coaching.	Product development and project management; team coaching.	Business and investment planning and pitching; team coaching.		
Masters assessments.	Feasibility report; Reflective journal	Project management report; reflective journal	Business and investment plan/ pitch deck
